POPULATION ESTIMATES 1985-1987

The Office of Planning and Budget (OPB) is designated by state law as the official demographic center for the State of Georgia. In this capacity, OPB has produced population estimates and projections since 1971. During this time, extensive research has been conducted relative to estimate and projection methodologies. Additionally, OPB has been designated by the Governor to participate in the Federal-State Cooperative Program for Local Population Estimates. The objective of this program is the development and publication of population estimates for counties using uniform procedures standardized for data input and methodology. Also, OPB serves as a member of the Federal-State Task Force for Population Projections and is an official review agency of population projections prepared by the U.S. Bureau of Economic Analysis. As part of these programs, OPB works directly with local governments, local planning commissions, state agencies, and many other groups in the public and private sector.

As part of OPB's information dissemination activities, OPB serves as the lead agency in Georgia for the State Data Center Program, a cooperative program between States and the U.S. Bureau of the Census. The purpose of this program is the timely and accurate dissemination of decennial and intercensal products.

The state estimates of population for the years 1985, 1986 and 1987 (preliminary) were derived utilizing data on births, deaths, auto registrations, school enrollment, income tax returns, homestead exemptions, medicare enrollment, and institutional population. Births and deaths were obtained from the State Department of Human Resources. This information is collected by place of residence and not by place of occurrence. Auto registrations, the number of income tax returns tabulated, and homestead exemptions were obtained from the State Department of Revenue. Public school enrollment was obtained from the State Department of Education (DOE). Private enrollment was acquired through a joint effort of OPB and DOE. Only data for grades 1-8 was utilized in our methodology. The medicare enrollment was obtained from the U.S. Bureau of the Census. Institutional population was collected by OPB from schools, hospitals, prisons, and military bases throughout Georgia.

In preparing the population estimates of the 1980's, change in variable data was analyzed as it related to change in the civilian-non-institutional population from 1970 to 1980. Components of that change, such as births, deaths, population age groups 1-5, 6-13, and 65 plus, and household size were evaluated relative to natural increase and net migration. No adjustment was made for census undercount. Statistics gathered from the above analysis were related to change in the input data for the 1980's to derive the estimates. The age 65 plus component was calculated using medicare data and its relationship to 1980 population age 65 plus by county. Population for the age cohort 0-13 was calculated from birth data and school enrollment data in conjunction with age-specific migration rates.

Proportional estimates of total net migration derived from auto registrations, income tax returns, and homestead exemptions were averaged to yield resulting net migration at both the state and county level. The counties were controlled to the independent state derived estimate. Net migration totals combined with natural increase produced the resulting estimates. The equation producing the civilian estimates was as follows:

$$CP_i = B_i - D_i + (.471367\ A_i + 3.474855\ H_i + .992575\ T_i) / 3$$

where:

CP = Civilian non-institutional population for April 1
B = Births
D = Deaths
A = Auto registrations
H = Homestead exemption change
T = Tax return change
i = Year

Military and institutional population was then added in to yield the resident population.

The methodology employed is what distinguishes these estimates from estimates produced by other agencies. There are many methods for estimating and projecting population, and no one method can be considered the best approach. In reality, the user should consider estimates and projections as guidelines for what is occurring in a state or county. Used in this capacity, the estimates contained in this report should prove extremely helpful. In our efforts, OPB has attempted to provide to users of population data a set of estimates for Georgia based on a sound methodology applied consistently throughout Georgia. A state control total has been applied to preclude an unreasonably large or small estimate.

In order to give the user an indication of relative error rates, the OPB estimated 1980 population, prepared prior to 1980, compared to the 1980 Census is as follows:

Frequency	County Population Size	Average Size	Error
10	100,000 +	249,284	2.57%
12	50,000 - 99,999	63,782	4.96%
28	25,000 - 49,999	33,430	4.72%
61	10,000 - 24,999	15,509	4.94%
38	5,000 - 9,999	7,665	4.67%
10	Under 5,000	3,150	9.78%
	State	5,463,105	.62%

Percent error was calculated without regard to sign. As the table indicates, the margin of error usually increases as the size of the county decreases.

Questions concerning this report should be addressed to:

Division of Demographic and Statistical Services
Office of Planning and Budget
